

high plateau (mesa) with a layer of older rock on top of a layer of newer rock (according to the 'column'), but the area involved is so extensive that no known force would be able to overcome the friction caused by an attempt to have one layer slide over the other layer (the argument that is used)—this also is impossible for the 'geologic column'.

Some 60 miles southwest of Dallas, Texas, there is a town called Glen Rose, that is close to the Paluxy River. The Dinosaur Valley State Park is located there, because the river bed has tracks of two types of dinosaur: three-toed and four-toed. Upriver from the park a paleontologist named Dr. Carl Baugh bought a significant amount of land on both sides of the river, so he could do his own excavations. On his property he has a museum that I myself have visited. In the **same layer** of sedimentary rock he encountered the following: two trilobite fossils, that evolutionists say existed 550 million years ago; a fossilized moss called 'lapidodendron', that evolutionists say existed 250 million years ago; a complete fossil of a dinosaur called 'acrocantzasaurus' (40 feet long), that evolutionists say existed 100 million years ago; seven tracks of a huge 'cat', that evolutionists say existed 6 million years ago; 57 human footprints (some being inside a dinosaur track); the fourth finger of a woman's left hand, fossilized; and even a pre-deluvian iron hammer (its iron does not rust, being 96.6% iron and 2.7% chlorine)—**all of that in the very same layer of sedimentary rock!**

It follows that a geologic column does not exist; it is a perverse invention perpetrated by dishonest and perverse persons. All those fossils were produced by Noah's Flood, about 4,365 years ago; otherwise, how can you explain that all those things are in the very same layer of rock? (We may note in passing that it is common for defenders of the 'geologic column' to argue in a circle: the age of a rock layer is determined by the fossils it contains, while the age of a fossil is determined by the rock layer where it is found!)

Furthermore, the earth is young. In the royal observatory in England they have been measuring the force of the magnetic field that surrounds the earth each year since 1839. They have found that the magnetic force is diminishing at a constant rate, or geometric progression: plotting the yearly values on a graph, they form a cline. This means that it is possible to project the line in both directions. If we project the line to a point 10,000 years ago, the magnetic force would be so strong that it would crush all life on the planet. It follows that any theory that requires millions, or billions of years is stupidly, ridiculously impossible.
