Key:

- x = an uncorrected variant that it is attested by MSS outside the family;
- y = a split that is not limited to the family;
- / = a split within the family (no outside attestation);
- c = a variant of any kind that has been corrected to the presumed archetype;
- s = singular reading / private variant (until all MSS have been collated, this is just an assumption);
- h = an obvious case of homoioteleuton (or –arcton), often involving a line or more, but can be just three or four words;
- i = sheer inattention;
- = no departures from the presumed profile.

Implications

I begin with the last column in the chart, ‘Exemplar’. Except for 18, 928, 1864 and 2723 that are themselves perfect, most of the others have a different rating. All singular readings should be discounted (including homoioteleuton and inattention); if not introduced by the copyist it was done by the ‘father’ or ‘grandfather’—an ancestor was free of all ‘singulars’, so they contribute nothing to the history of the transmission, are not relevant to the tracing of that transmission. All variants that were corrected to the
