

18 and 35 to represent Soden's **K**^r, and GA 319, 424, 468, 617 and 2423 to represent the core Byzantine MSS that were excluded.

I list four **f**³⁵ readings (for 1 John) as having 30% overall attestation, or less, which would make them more or less diagnostic **f**³⁵ readings. In the chart below, those readings form the first line, and below each reading I list the MSS that *ECM* gives as supporting each one. Since GA 18 and 35 have them all, of course, they are not listed. I will discuss the implications below, but first, the evidence (numbers with an asterisk are classed as Byzantine):
