

correction]

130. 19:25b μαγδαληνη || μαγδαλινη 1384 [] 1071 [this is simply an alternate spelling, and therefore not a proper variant]
131. 19:28 τουτο || ταυτα [] U [an independent error that does not affect the meaning]
132. 20:5 κειμενα || --- [] Λ [the omission does not alter the meaning]
133. 20:11 τω μνημειω || το μνημειον [50%] Θ, Λ, f¹³, 579, 1071, 1346, 1424 [the preposition works with both dative and accusative; in the context the meaning is not affected]
134. 20:19 αυτοις || --- [] Σ [an independent omission that does not alter the meaning]
135. 21:13 ουν || --- [2%] P¹²² Σ, B, C, D, W, f¹ [an independent error, presumably, given the copyist's penchant for omitting this conjunction; the meaning is not affected]
136. 21:15 ο ιησους || --- [] 1424 [an error that does not affect the meaning]

As Family 35 representatives go, this is a disappointing manuscript, but let us analyze the variations in detail. Of the 136 deviations from the family archetype, 54 are singular readings: with few exceptions, these do not affect the meaning, including a number that are not proper variants—what I have called a “careless singular” (above) I consider to be an unintentional error, and therefore not a proper variant. If no other known MS has a given change, then something created in the 17th century is not a variant. $136 - 54 = 82$, so let us turn our attention to the 82. Of these, nine are mere alternate spellings, and therefore not proper variants (they are: 1, 13, 27, 58, 61, 65, 125, 127, 130). $82 - 9 = 73$; of these, 16 are deviations shared by early codices, where it is scarcely credible that there could be a dependency, making them singular readings as far as the copyist of 1700 is concerned (10, 26, 36, 41, 48, 49, 52, 57, 73, 76, 96, 97, 131, 132, 134, 135). I would say that the correct deduction to be made from the evidence before us is that the copyists who produced those early MSS were also careless, marring their work with stupid errors. $73 - 16 = 57$ (well under half of the total).

Looking at the evidence, it seems clear that GA 1700 contains some mixture. Of the 66 non-singulars ($136 - 54 - 16 = 66$), 1700 shares a variant with 1424 thirty times, with 1071 twenty-eight times, with 28 twenty-four times, with f¹³ twenty-two times, with 579 twenty-one times, with Λ nineteen times. **However**, an analysis of the 66 variants, and for that matter
