

Fair enough. If **K<sup>r</sup>** (**M<sup>7</sup>**) was preserved in its ‘separate integrity’ during ‘a long line of transmission’ then it would have to have its origin ‘at a time well before the 9<sup>th</sup> century’. Besides the witness of 35, Robinson’s collations demonstrate that minuscule 1166 and lectionary 139, both of the **X** century, reflect **K<sup>r</sup>**. If they are copies, not new creations, then their exemplars had to be older, and so on. Without adducing any further evidence, it seems fair to say that **K<sup>r</sup>** must have existed already in the **IX** century, if not the **VIII**.

For years, based on the *Text und Textwert* series, I have insisted that **K<sup>r</sup>** is both ancient and independent. Robinson would seem to agree. “The lack of extensive cross-comparison and correction demonstrated in the extant MSS containing the PA precludes the easy development of any existing form of the PA text from any other form of the PA text during at least the vellum era.”<sup>1</sup> “The vellum era”—does not that take us back to the **IV** century, at least? As a matter of fact, yes. Consider:

|             |                                                                     |                                                                                                                                                                                                                 |

---

his language there is certainly plain enough. Further, I had a copy of his collations in my hand for two months, spending much of that time poring over them, and saw no reason to question his conclusions in the Nov., 1998 article.]
